

Kubernetes

Installing Kubernetes

How to create a Kubernetes Cluster

1. Locally via Minikube, Kind, k3s
2. Managed Kubernetes Services like
 1. GKE: Google Kubernetes Engine
 2. EKS: Amazon Elastic Kubernetes Service
 3. AKS: Azure Kubernetes Service (AKS)

Let's create a cluster locally using Minikube, Install [here](#)

Minikube commands

- `minikube start`
- `minikube stop`
- `minikube delete`
- `minikube status`
- `minikube dashboard`
- `minikube node add` (adds a new node to the Minikube cluster, useful for multi-node setups)
- `minikube node delete <node-name>` (removes a node from the Minikube cluster)

kubectl commands

- `kubectl cluster-info`: Shows information about the cluster.
- `kubectl get namespaces`: Lists all namespaces in the cluster.
- `kubectl get nodes`: Lists all nodes in the cluster.
- `kubectl describe node <node-name>`: Shows detailed information about a specific node.
